

SPLIT-TYPE AIR CONDITIONERS

#### Revision A:

- 9-2. CAPACITY AND INPUT CORRECTION BY
   OPERATIONAL FREQUENCY OF COMPRESSOR has been modified.
- Resistance value of the R.V. coil for MUZ-LN25/35/50VG-E1, ER1, ET1 has been corrected (12-4.).

OBH767 is void.

#### NOTE:

RoHS compliant products have <G> mark on the spec name plate.

# Use the specified refrigerant only

#### Never use any refrigerant other than that specified.

Doing so may cause a burst, an explosion, or fire when the unit is being used, serviced, or disposed of. Correct refrigerant is specified in the manuals and on the spec labels provided with our products. We will not be held responsible for mechanical failure, system malfunction, unit breakdown or accidents caused by failure to follow the instructions.

#### SERVICING PRECAUTIONS FOR UNITS USING REFRIGERANT R32

#### Servicing precautions for units using refrigerant R32

#### **∕** WARNING

This unit uses a flammable refrigerant.

If refrigerant leaks and comes in contact with fire or heating part, it will create harmful gas and there is risk of fire.

- Do not use means to accelerate the defrosting process or to clean, other than those recommended by the manufacturer.
- The appliance shall be stored in a room without continuously operating ignition sources (for example: open flames, an operating gas appliance or an operating electric heater.)
- Do not pierce or burn.
- Be aware that refrigerants may not contain an odor.
- Pipe-work shall be protected from physical damage.
- The installation of pipe-work shall be kept to a minimum.
- Compliance with national gas regulations shall be observed.
- Keep any required ventilation openings clear of obstruction.
- Servicing shall be performed only as recommended by the manufacturer.
- The appliance shall be stored so as to prevent mechanical damage from occurring.

## Basic work procedures are the same as those for conventional units using refrigerant R410A. However, pay careful attention to the following points.

- 1. Information on servicing
- Checks on the Area
  - Prior to beginning work on systems containing flammable refrigerants, safety checks are necessary to ensure that the risk of ignition is minimized.
- ② Work Procedure
  - Work shall be undertaken under a controlled procedure so as to minimize the risk of a flammable gas or vapor being present while the work is being performed.
- ③ General Work Area
  - All maintenance staff and others working in the local area shall be instructed on the nature of work being carried out. Work in confined spaces shall be avoided. The area around the workspace shall be sectioned off. Ensure that the conditions within the area have been made safe by control of flammable material.
- 4 Checking for Presence of Refrigerant
  - The area shall be checked with an appropriate refrigerant detector prior to and during work, to ensure the technician is aware of potentially toxic or flammable atmospheres. Ensure that the leak detection equipment being used is suitable for use with all applicable refrigerants, i.e. non-sparking, adequately sealed or intrinsically safe.
- (5) Presence of Fire Extinguisher
  - If any hot work is to be conducted on the refrigeration equipment or any associated parts, appropriate fire extinguishing equipment shall be available to hand. Have a dry powder or CO2 fire extinguisher adjacent to the charging area.
- 6 No Ignition Sources
  - No person carrying out work in relation to a refrigeration system which involves exposing any pipe work shall use any sources of ignition in such a manner that it may lead to the risk of fire or explosion. All possible ignition sources, including cigarette smoking, should be kept sufficiently far away from the site of installation, repairing, removing and disposal, during which refrigerant can possibly be released to the surrounding space. Prior to work taking place, the area around the equipment is to be surveyed to make sure that there are no flammable hazards or ignition risks. "No Smoking" signs shall be displayed.
- Ventilated Area
  - Ensure that the area is in the open or that it is adequately ventilated before breaking into the system or conducting any hot work. A degree of ventilation shall continue during the period that the work is carried out. The ventilation should safely disperse any released refrigerant and preferably expel it externally into the atmosphere.
- ® Checks on the Refrigeration Equipment
  - Where electrical components are being changed, they shall be fit for the purpose and to the correct specification. At all times the manufacturer's maintenance and service guidelines shall be followed. If in doubt, consult the manufacturer's technical department for assistance.

The following checks shall be applied to installations using flammable refrigerants:

- The charge size is in accordance with the room size within which the refrigerant containing parts are installed.
- The ventilation machinery and outlets are operating adequately and are not obstructed.
- If an indirect refrigerating circuit is being used, the secondary circuit shall be checked for the presence of refrigerant.
- Marking to the equipment continues to be visible and legible. Markings and signs that are illegible shall be corrected.
- Refrigeration pipe or components are installed in a position where they are unlikely to be exposed to any substance which may corrode refrigerant containing
  components, unless the components are constructed of materials which are inherently resistant to being corroded or are suitably protected against being corroded.
- Ohecks on Electrical Devices

Repair and maintenance to electrical components shall include initial safety checks and component inspection procedures. If a fault exists that could compromise safety, then no electrical supply shall be connected to the circuit until it is satisfactorily dealt with. If the fault cannot be corrected immediately but it is necessary to continue operation, an adequate temporary solution shall be used. This shall be reported to the owner of the equipment so all parties are advised. Initial safety checks shall include that:

- capacitors are discharged: this shall be done in a safe manner to avoid possibility of sparking;
- no live electrical components and wiring are exposed while charging, recovering or purging the system;
- there is continuity of earth bonding
- 2. Repairs to Sealed Components
- ① During repairs to sealed components, all electrical supplies shall be disconnected from the equipment being worked upon prior to any removal of sealed covers, etc. If it is absolutely necessary to have an electrical supply to equipment during servicing, then a permanently operating form of leak detection shall be located at the most critical point to warn of a potentially hazardous situation.
- ② Particular attention shall be paid to the following to ensure that by working on electrical components, the casing is not altered in such a way that the level of protection is affected. This shall include damage to cables, excessive number of connections, terminals not made to original specification, damage to seals, incorrect fitting of glands, etc.

Ensure that the apparatus is mounted securely.

Ensure that seals or sealing materials have not degraded to the point that they no longer serve the purpose of preventing the ingress of flammable atmospheres. Replacement parts shall be in accordance with the manufacturer's specifications.

3. Repair to intrinsically Safe Components

Do not apply any permanent inductive or capacitance loads to the circuit without ensuring that this will not exceed the permissible voltage and current permitted for the equipment in use.

Intrinsically safe components are the only types that can be worked on while live in the presence of a flammable atmosphere. The test apparatus shall be at the correct rating.

Replace components only with parts specified by the manufacturer. Other parts may result in the ignition of refrigerant in the atmosphere from a leak.

4. Cabling

Check that cabling will not be subject to wear, corrosion, excessive pressure, vibration, sharp edges or any other adverse environmental effects. The check shall also take into account the effects of aging or continual vibration from sources such as compressors or fans.

#### 5. Detection of Flammable Refrigerants

Under no circumstances shall potential sources of ignition be used in the searching for or detection of refrigerant leaks. A halide torch (or any other detector using a naked flame) shall not be used.

#### 6. Leak Detection Methods

Electronic leak detectors may be used to detect refrigerant leaks but, in the case of flammable refrigerants, the sensitivity may not be adequate, or may need re-calibration. (Detection equipment shall be calibrated in a refrigerant-free area.) Ensure that the detector is not a potential source of ignition and is suitable for the refrigerant used. Leak detection equipment shall be set at a percentage of the LFL of the refrigerant and shall be calibrated to the refrigerant employed, and the appropriate percentage of gas (25 % maximum) is confirmed.

Leak detection fluids are suitable for use with most refrigerants but the use of detergents containing chlorine shall be avoided as the chlorine may react with the refrigerant and corrode the copper pipe-work.

If a leak is suspected, all naked flames shall be removed/extinguished.

If a leakage of refrigerant is found which requires brazing, all of the refrigerant shall be recovered from the system, or isolated (by means of shut off valves) in a part of the system remote from the leak. For appliances containing flammable refrigerants, oxygen free nitrogen (OFN) shall then be purged through the system both before and during the brazing process.

#### 7. Removal and Evacuation

When breaking into the refrigerant circuit to make repairs - or for any other purpose conventional procedures shall be used. However, for flammable refrigerants it is important that best practice is followed since flammability is a consideration. The following procedure shall be adhered to:

- remove refrigerant
- purge the circuit with inert gas
- evacuate
- purge again with inert gas
- open the circuit by cutting or brazing.

The refrigerant charge shall be recovered into the correct recovery cylinders. For appliances containing flammable refrigerants, the system shall be "flushed" with OFN to render the unit safe. This process may need to be repeated several times. Compressed air or oxygen shall not be used for purging refrigerant systems.

For appliances containing flammable refrigerants, flushing shall be achieved by breaking the vacuum in the system with OFN and continuing to fill until the working pressure is achieved, then venting to atmosphere, and finally pulling down to a vacuum. This process shall be repeated until no refrigerant is within the system. When the final OFN charge is used, the system shall be vented down to atmospheric pressure to enable work to take place. This operation is absolutely vital if brazing operations on the pipe-work are to take place.

Ensure that the outlet for the vacuum pump is not close to any ignition sources and that ventilation is available.

#### 8. Charging Procedures

In addition to conventional charging procedures, the following requirements shall be followed:

- Ensure that contamination of different refrigerants does not occur when using charging equipment. Hoses or lines shall be as short as possible to minimize the amount of refrigerant contained in them.
- Cylinders shall be kept upright.
- Ensure that the refrigeration system is earthed prior to charging the system with refrigerant.
- Label the system when charging is complete (if not already).
- Extreme care shall be taken not to overfill the refrigeration system.

Prior to recharging the system, it shall be pressure-tested with the appropriate purging gas. The system shall be leak-tested on completion of charging but prior to commissioning. A follow up leak test shall be carried out prior to leaving the site.

#### 9. Decommissioning

Before carrying out this procedure, it is essential that the technician is completely familiar with the equipment and all its detail. It is recommended good practice that all refrigerants are recovered safely. Prior to the task being carried out, an oil and refrigerant sample shall be taken in case analysis is required prior to reuse of reclaimed refrigerant. It is essential that electrical power is available before the task is commenced.

- a) Become familiar with the equipment and its operation.
- b) Isolate system electrically.
- c) Before attempting the procedure, ensure that:
  - mechanical handling equipment is available, if required, for handling refrigerant cylinders;
- all personal protective equipment is available and being used correctly;
- the recovery process is supervised at all times by a competent person;
- recovery equipment and cylinders conform to the appropriate standards.
- d) Pump down refrigerant system, if possible
- e) If a vacuum is not possible, make a manifold so that refrigerant can be removed from various parts of the system.
- f) Make sure that cylinder is situated on the scales before recovery takes place.
- g) Start the recovery machine and operate in accordance with manufacturer's instructions.
- h) Do not overfill cylinders. (no more than 80 % volume liquid charge).
- i) Do not exceed the maximum working pressure of the cylinder, even temporarily.
- j) When the cylinders have been filled correctly and the process completed, make sure that the cylinders and the equipment are removed from site promptly and all isolation valves on the equipment are closed off.
- k) Recovered refrigerant shall not be charged into another refrigeration system unless it has been cleaned and checked.

#### 10. Labeling

Equipment shall be labeled stating that it has been de-commissioned and emptied of refrigerant. The label shall be dated and signed. For appliances containing flammable refrigerants, ensure that there are labels on the equipment stating the equipment contains flammable refrigerant.

#### 11. Recovery

When removing refrigerant from a system, either for servicing or decommissioning, it is recommended good practice that all refrigerants are removed safely. When transferring refrigerant into cylinders, ensure that only appropriate refrigerant recovery cylinders are employed. Ensure that the correct number of cylinders for holding the total system charge are available. All cylinders to be used are designated for the recovered refrigerant and labeled for that refrigerant (i.e. special cylinders for the recovery of refrigerant). Cylinders shall be complete with pressure-relief valve and associated shut-off valves in good working order. Empty recovery cylinders are evacuated and, if possible, cooled before recovery occurs.

The recovery equipment shall be in good working order with a set of instructions concerning the equipment that is at hand and shall be suitable for the recovery of all appropriate refrigerants including, when applicable, flammable refrigerants. In addition, a set of calibrated weighing scales shall be available and in good working order. Hoses shall be complete with leak-free disconnect couplings and in good condition. Before using the recovery machine, check that it is in satisfactory working order, has been properly maintained and that any associated electrical components are sealed to prevent ignition in the event of a refrigerant release. Consult manufacturer if in doubt.

The recovered refrigerant shall be returned to the refrigerant supplier in the correct recovery cylinder, and the relevant waste transfer note arranged. Do not mix refrigerants in recovery units and especially not in cylinders.

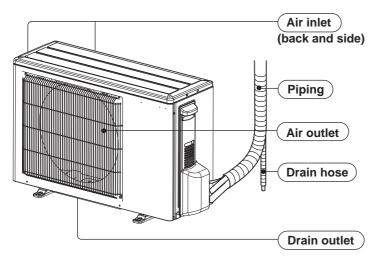

If compressors or compressor oils are to be removed, ensure that they have been evacuated to an acceptable level to make certain that flammable refrigerant does not remain within the lubricant. The evacuation process shall be carried out prior to returning the compressor to the suppliers. Only electric heating to the compressor body shall be employed to accelerate this process. When oil is drained from a system, it shall be carried out safely.

### PERFORMANCE CURVES

#### MUZ-LN25VG MUZ-LN35VG MUZ-LN50VG MUZ-LN60VG

The standard specifications apply only to the operation of the air conditioner under normal conditions. Since operating conditions vary according to the areas where these units are installed, the following information has been provided to clarify the operating characteristics of the air conditioner under the conditions indicated by the performance curve.

#### (1) GUARANTEED VOLTAGE

198 ~ 264 V. 50 Hz

#### (2) AIR FLOW

Air flow should be set at MAX.

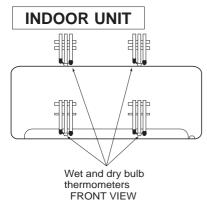

#### (3) MAIN READINGS

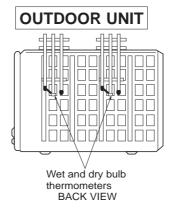

| <ul><li>(1) Indoor intake air wet-bulb temperature:</li><li>(2) Indoor outlet air wet-bulb temperature:</li><li>(3) Outdoor intake air dry-bulb temperature:</li><li>(4) Total input:</li></ul> | °C [WB] °C [WB] °C [DB] W | Cooling  |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------|----------|
| <ul><li>(5) Indoor intake air dry-bulb temperature:</li><li>(6) Outdoor intake air wet-bulb temperature:</li></ul>                                                                              | °C [DB]                   | Heating  |
| (7) Total input:                                                                                                                                                                                | W [WB]                    | ricating |

Indoor air wet and dry bulb temperature difference on the left side of the following chart shows the difference between the indoor intake air wet and dry bulb temperature and the indoor outlet air wet and dry bulb temperature for your reference at service.

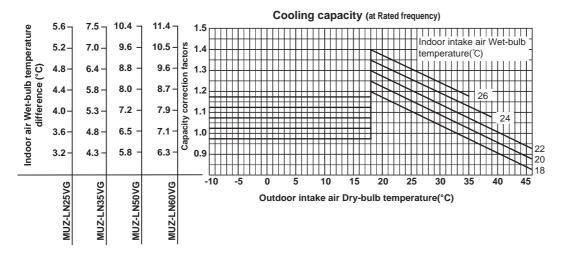

#### How to measure the indoor air wet and dry bulb temperature difference

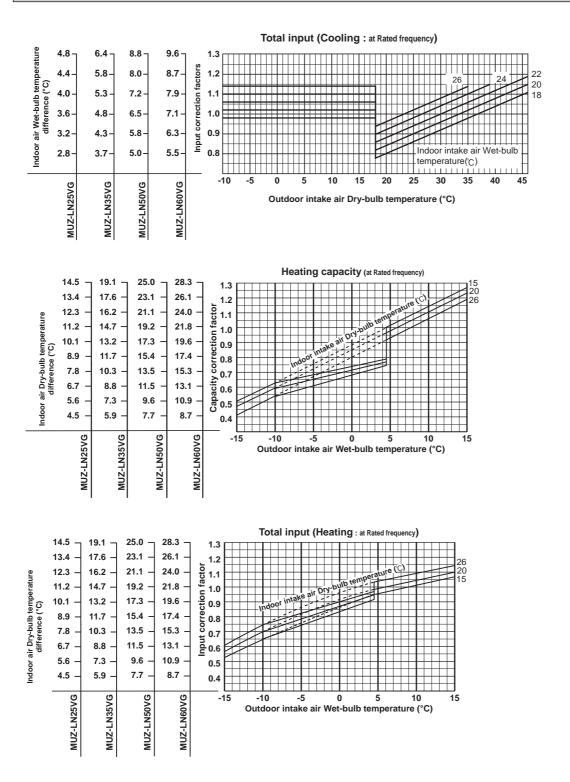

- 1. Attach at least 2 sets of wet and dry bulb thermometers to the indoor air intake as shown in the figure, and at least 2 sets of wet and dry bulb thermometers to the indoor air outlet. The thermometers must be attached to the position where air speed is high.
- 2. Attach at least 2 sets of wet and dry bulb thermometers to the outdoor air intake. Cover the thermometers to prevent direct rays of the sun.
- 3. Check that the air filter is cleaned.
- 4. Open windows and doors of room.
- 5. Press the EMERGENCY OPERATION switch once (twice) to start the EMERGENCY COOL (HEAT) MODE.
- 6. When system stabilizes after more than 15 minutes, measure temperature and take an average temperature.
- 7. 10 minutes later, measure temperature again and check that the temperature does not change.

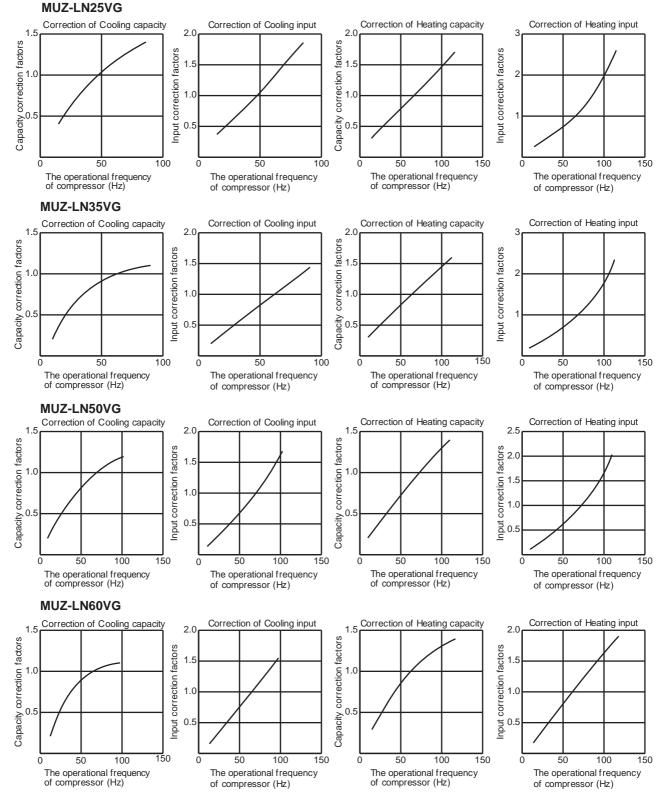

#### 9-1. CAPACITY AND INPUT CURVES

**NOTE:** The above broken lines are for the heating operation without any frost and defrost operation.

### 9-2. CAPACITY AND INPUT CORRECTION BY OPERATIONAL FREQUENCY OF COMPRESSOR

#### 9-3. HOW TO OPERATE FIXED-FREQUENCY OPERATION

<Test run operation>

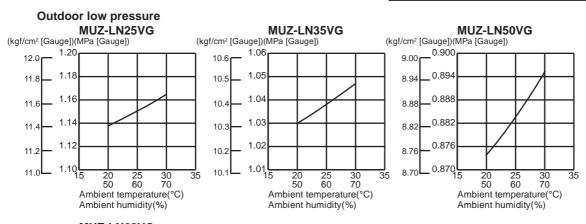

- 1. Press EMERGENCY OPERATION switch to start COOL or HEAT mode (COOL: Press once, HEAT: Press twice).
- 2. Test run operation starts and continues to operate for 30 minutes.
- 3. Compressor operates at rated frequency in COOL mode or 58 Hz in HEAT mode.
- 4. Indoor fan operates at High speed.
- 5. After 30 minutes, test run operation finishes and EMERGENCY OPERATION starts (operation frequency of compressor varies).
- 6. To cancel test run operation (EMERGENCY OPERATION), press EMERGENCY OPERATION switch or any button on remote controller.

#### 9-4. OUTDOOR LOW PRESSURE AND OUTDOOR UNIT CURRENT

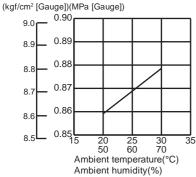

#### **COOL** operation

- Both indoor and outdoor unit are under the same temperature/ humidity condition.
- ② Operation: TEST RUN OPERATION (Refer to 8-3.)

| Dry-bulb temperature (°C) | Relative humidity (%) |
|---------------------------|-----------------------|
| 20                        | 50                    |
| 25                        | 60                    |
| 30                        | 70                    |

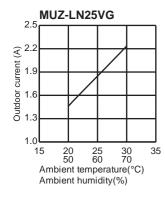

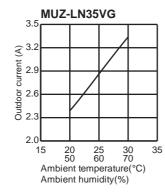

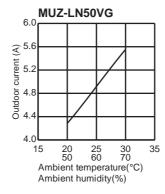

#### NOTE:

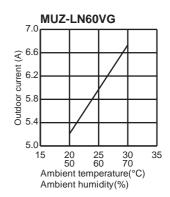

The unit of pressure has been changed to MPa on the international system of units (SI unit system) The conversion factor is: 1 (MPa [Gauge]) = 10.2 (kgf/cm² [Gauge])

#### **Outdoor unit current**

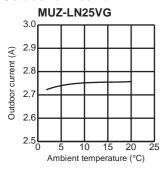

### **HEAT** operation

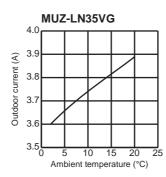

① Condition:

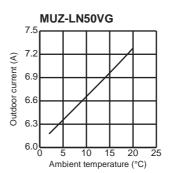

|                           | Indoor | or Outdoor |   |    |      |  |  |  |  |
|---------------------------|--------|------------|---|----|------|--|--|--|--|
| Dry bulb temperature (°C) | 20.0   | 2          | 7 | 15 | 20.0 |  |  |  |  |
| Wet bulb temperature (°C) | 14.5   | 1          | 6 | 12 | 14.5 |  |  |  |  |

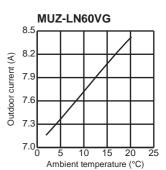

② Operation: Test run operation (Refer to 8-3.)

#### **Outdoor unit current**

#### 10-1. OUTDOOR FAN MOTOR CONTROL

The fan motor turns ON/OFF, interlocking with the compressor.

[ON] The fan motor turns ON 5 seconds before the compressor starts up.

[OFF] The fan motor turns OFF 15 seconds after the compressor has stopped running.

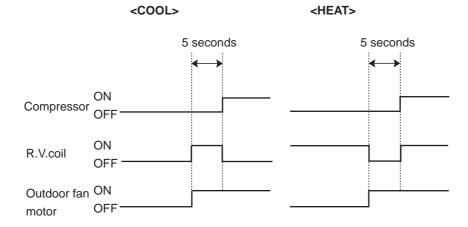

#### 10-2. R.V. COIL CONTROL

 Heating
 ON

 Cooling
 OFF

 Dry
 OFF

**NOTE:** The 4-way valve reverses for 5 seconds right before startup of the compressor.

#### 10-3. RELATION BETWEEN MAIN SENSOR AND ACTUATOR

#### 11-2. PRE-HEAT CONTROL SETTING

#### **PRE-HEAT CONTROL**

#### MUZ-LN25/35/50

When moisture gets into the refrigerant cycle, it may interfere the startup of the compressor at low outside temperature. The pre-heat control prevents this interference. The pre-heat control turns ON when the discharge temperature thermistor is 20°C or below. When the pre-heat control turns ON, the compressor is energized. (About 50 W)

#### **MUZ-LN60**

Prolonged low load operation, in which the thermostat is OFF for a long time, at low outside temperature (0°C or less) may cause the following troubles. To prevent those troubles, activate the pre-heat control.

- 1) If moisture gets into the refrigerant cycle and freezes, it may interfere the startup of the compressor.
- 2) If liquid refrigerant collects in the compressor, a failure in the compressor may occur.

The pre-heat control turns ON when the compressor temperature is 20°C or below. When the pre-heat control turns ON, the compressor is energized. (About 70 W)

#### Pre-heat control setting

<JK>

ON: To activate the pre-heat control, cut the JK wire of the inverter P.C. board.

OFF: To deactivate the pre-heat control, solder the JK wire of the inverter P.C. board.

(Refer to 12-6.1)

NOTE: When the inverter P.C. board is replaced, check the jumper wires, and cut/solder them if necessary.

#### 12-1. CAUTIONS ON TROUBLESHOOTING

- 1. Before troubleshooting, check the following
  - 1) Check the power supply voltage.
  - 2) Check the indoor/outdoor connecting wire for miswiring.
- 2. Take care of the following during servicing
  - 1) Before servicing the air conditioner, be sure to turn OFF the main unit first with the remote controller, and then after confirming the horizontal vane is closed, turn OFF the breaker and/or disconnect the power plug.
  - 2) Be sure to turn OFF the power supply before removing the front panel, the cabinet, the top panel, and the electronic control P.C. board.
  - 3) When removing the electrical parts, be careful of the residual voltage of smoothing capacitor.
  - 4) When removing the electronic control P.C. board, hold the edge of the board with care NOT to apply stress on the components.
  - 5) When connecting or disconnecting the connectors, hold the connector housing. DO NOT pull the lead wires.

#### 3. Troubleshooting procedure

- Check if the OPERATION INDICATOR lamp on the indoor unit is flashing on and off to indicate an abnormality.
   To make sure, check how many times the OPERATION INDICATOR lamp is flashing on and off before starting service work.
- 2) Before servicing, check that the connector and terminal are connected properly.
- 3) When the electronic control P.C. board seems to be defective, check the copper foil pattern for disconnection and the components for bursting and discoloration.
- 4) Refer to 12-2 and 12-3.

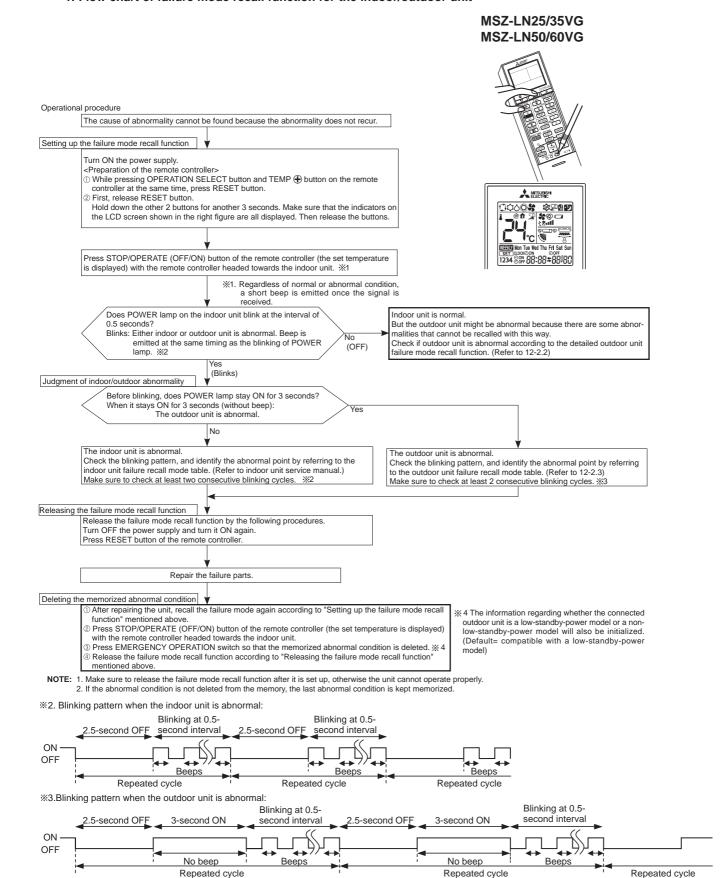

#### 12-2. FAILURE MODE RECALL FUNCTION

Outline of the function

This air conditioner can memorize the abnormal condition which has occurred once.

Even though LED indication listed on the troubleshooting check table (12-3.) disappears, the memorized failure details can be recalled.

#### 1. Flow chart of failure mode recall function for the indoor/outdoor unit

#### 2. Flow chart of the detailed outdoor unit failure mode recall function

Repeated cycle

#### Operational procedure The outdoor unit might be abnormal. Check if outdoor unit is abnormal according to the following procedures. Make sure that the remote controller is set to the failure mode recall function %1. Regardless of normal or abnormal condition, 2 short With the remote controller headed towards the indoor unit, press TEMP ⊕ button to adjust the set temperature to 25°C. ※1 beeps are emitted as the signal is received. NOTE: It takes up to 1 minute to indicate the outdoor unit abnormality. Even if POWER lamp is not lighting, keep checking at least 1 minute or longer. Does POWER lamp on the indoor unit blink at the interval of 0.5 seconds? Blinks: The outdoor unit is abnormal. Beep is emitted at the same timing as the blinking of POWER (OFF) lamp. ×2 Yes (Blinks) The outdoor unit is abnormal. Check the blinking pattern, and identify the abnormal point by referring to the outdoor unit failure recall mode table (12-2.3.). The outdoor unit is normal. Make sure to check at least two consecutive blinking cycles. x2 Releasing the failure mode recall function Release the failure mode recall function accord-Release the failure mode recall function by the following procedures. Turn OFF the power supply and turn it ON again. Press RESET button of the remote controller. ing to the left mentioned procedure. Repair the failure parts. Deleting the memorized abnormal condition ① After repairing the unit, recall the failure mode again according to "Setting up the failure mode recall \*4 The information regarding whether the function" (12-2.1.) connected outdoor unit is a low-standby-② Press STOP/OPÉRATE (OFF/ON) button of the remote controller (the set temperature is displayed) with power model or a non-low-standby-power the remote controller headed towards the indoor unit. ③ Press EMERGENCY OPERATION switch so that the memorized abnormal condition is deleted. \*4 model will also be initialized. (Default= compatible with a low-standby-(4) Release the failure mode recall function according to "Releasing the failure mode recall function" menpower model) tioned above NOTE: 1. Make sure to release the failure mode recall function after it is set up, otherwise the unit cannot operate properly. 2. If the abnormal condition is not deleted from the memory, the last abnormal condition is kept memorized. \*2.Blinking pattern when outdoor unit is abnormal Blinking at 0.5-Blinking at 0.5second interval ON OFF No beep Beeps Beeps No beep

Repeated cycle

Repeated cycle

#### 12-5. TROUBLESHOOTING FLOW

#### A How to check inverter/compressor

#### **B** Check of open phase

• With the connector between the compressor and the power module (IC700) disconnected, activate the inverter and check if the inverter is normal by measuring **the voltage balance** between the terminals.

Output voltage is 50 - 130 V. (The voltage may differ according to the tester.)

<< Operation method>>

Start cooling or heating operation by pressing EMERGENCY OPERATION switch on the indoor unit. (TEST RUN OPERATION: Refer to 9-3.)

<<Measurement point>>

At 3 points

BLK (U)-WHT (V)

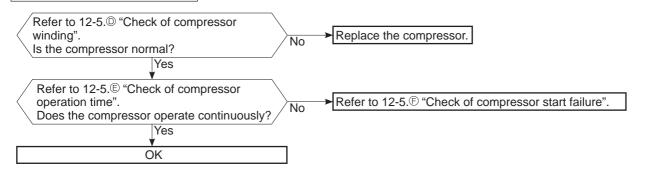

\* Measure AC voltage between the lead wires at 3 points.

BLK (U)-RED (W) WHT(V)-RED (W)

**NOTE**: 1. Output voltage varies according to power supply voltage.

- 2. Measure the voltage by analog type tester.
- 3. During this check, LED of the inverter P.C. board flashes 9 times. (Refer to 12-6.1.)

#### © Check of compressor

#### D Check of compressor winding

- Disconnect the connector between the compressor and the power module (IC700), and measure the resistance between the compressor terminals.
- <<Measurement point>>

At 3 points

BLK-WHT BLK-RED

\* Measure the resistance between the lead wires at 3 points.

WHT-RED

MUI-KED

<<Judgement>>

Refer to 12-4.

 $0 [\Omega]$  ......Abnormal [short] Infinite  $[\Omega]$  ......Abnormal [open]

NOTE: Be sure to zero the ohmmeter before measurement.

#### E Check of compressor operation time

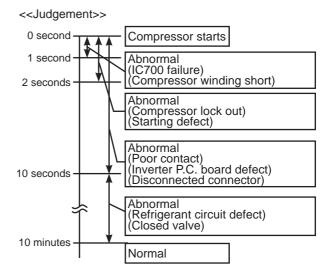

• Connect the compressor and activate the inverter. Then measure the time until the inverter stops due to overcurrent.

<<Operation method>>

Start heating or cooling operation by pressing EMERGENCY OPERATION switch on the indoor unit. (TEST RUN OPERATION: Refer to 9-3.)

<<Measurement>>

Measure the time from the start of compressor to the stop of compressor due to overcurrent.

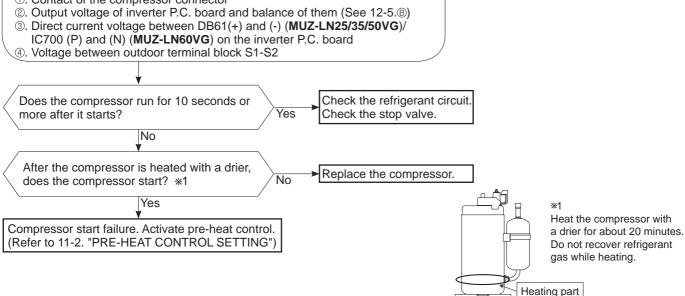

#### F Check of compressor start failure

Confirm that ①~④ is normal.

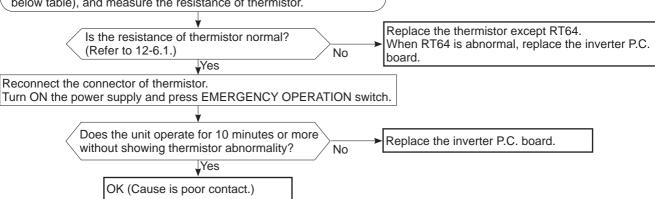

•Electrical circuit check

①. Contact of the compressor connector

#### **G** Check of outdoor thermistors

Disconnect the connector of thermistor in the inverter P.C. board (see below table), and measure the resistance of thermistor.

#### MUZ-LN25/35/50VG

| Thermistor                         | Symbol | Connector, Pin No.          | Board               |  |

#### (H) Check of R.V. coil

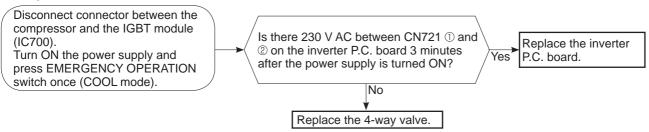

#### MUZ-LN25/35/50VG

- \* First of all, measure the resistance of R.V. coil to check if the coil is defective. Refer to 12-4.
- \* In case CN721 is disconnected or R.V. coil is open, voltage is generated between the terminal pins of the connector although no signal is being transmitted to R.V. coil. Check if CN721 is connected.

#### Unit operates COOL mode even if it is set to HEAT mode.

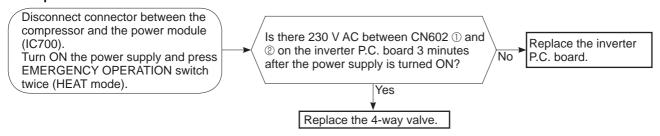

#### Unit operates HEAT mode even if it is set to COOL mode.

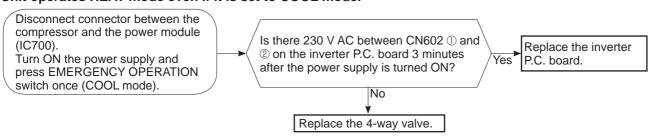

#### **MUZ-LN60VG**

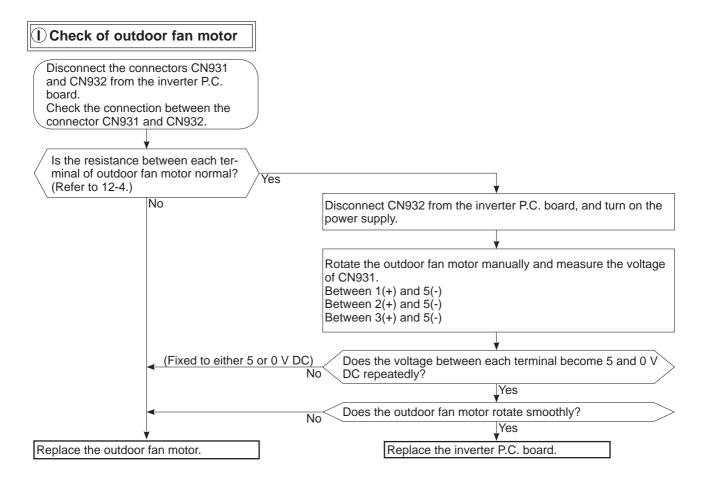

- \*\* First of all, measure the resistance of R.V. coil to check if the coil is defective. Refer to 11-4.
- \* In case CN602 is disconnected or R.V. coil is open, voltage is generated between the terminal pins of the connector although no signal is being transmitted to R.V. coil. Check if CN602 is connected.

#### Unit operates COOL mode even if it is set to HEAT mode.

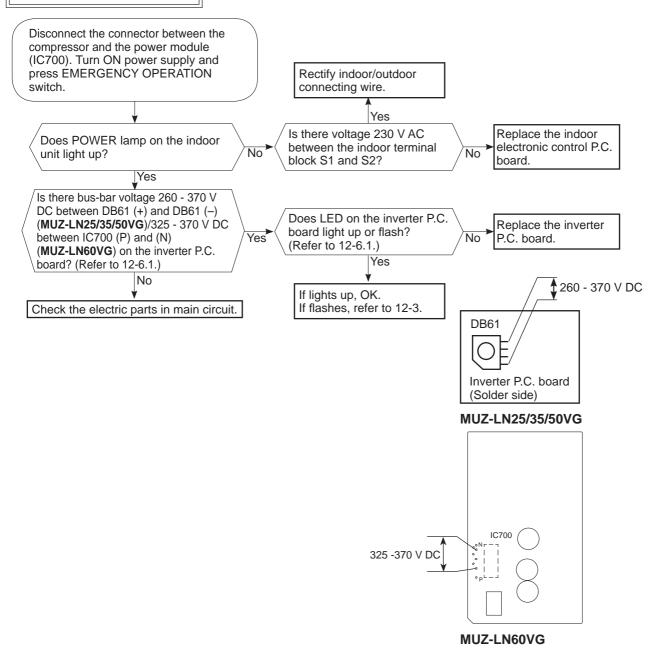

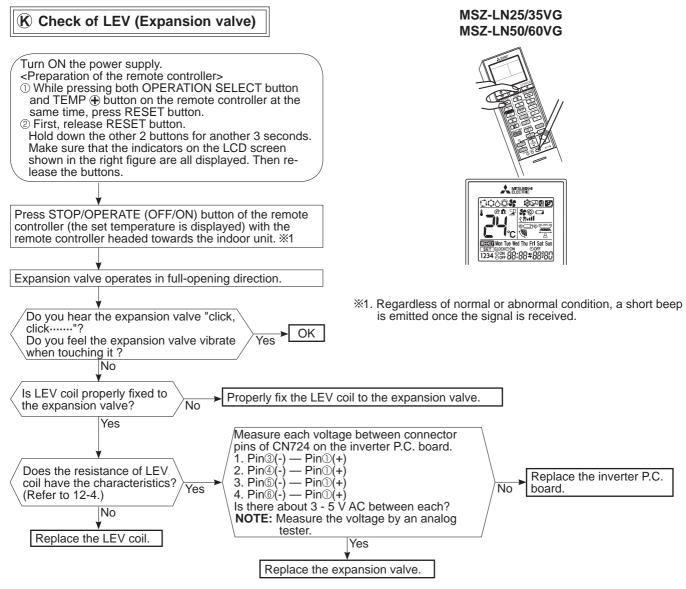

#### Unit operates HEAT mode even if it is set to COOL mode.

#### $oldsymbol{\mathbb{J}}$ Check of power supply

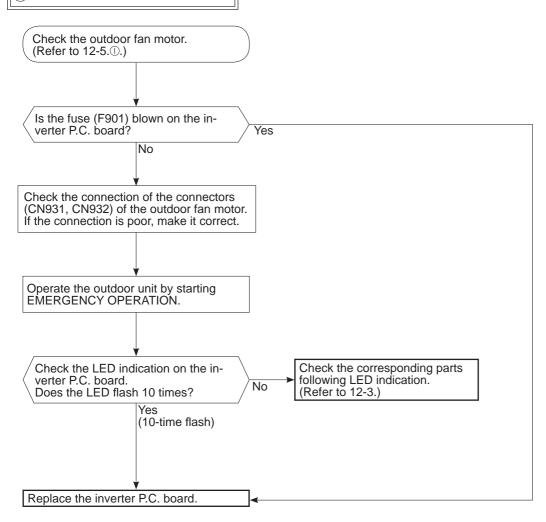

NOTE: After check of LEV, do the undermentioned operations.

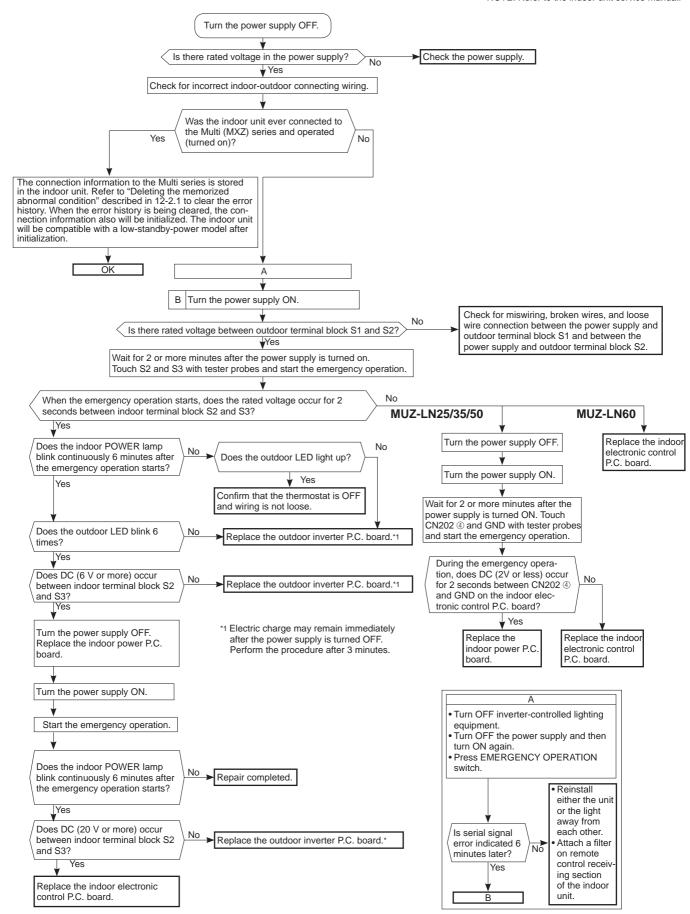

- 1. Turn OFF the power supply and turn it ON again.
- 2. Press RESET button on the remote controller.

#### L Check of inverter P.C. board

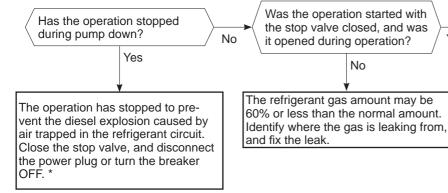

#### M How to check miswiring and serial signal error

NOTE: Refer to the indoor unit service manual.

#### N Check of the outdoor refrigerant circuit

start the cooling operation again.

Yes

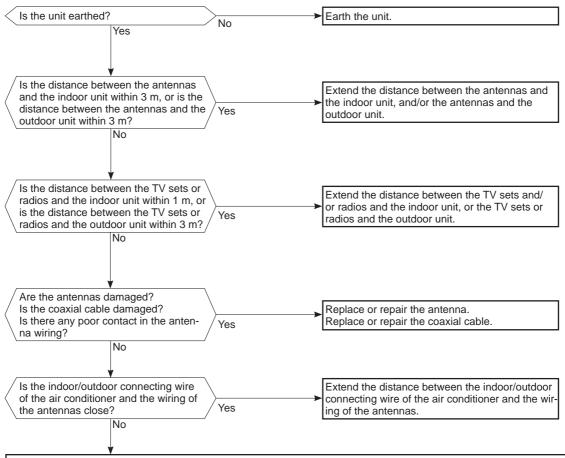

The unit occasionally stops when the

stop valve is opened or closed during

operation. Open the stop valve and

\* CAUTION : Do not start the operation again to prevent hazards.

#### O Electromagnetic noise enters into TV sets or radios

Even if all of the above conditions are fulfilled, the electromagnetic noise may enter, depending on the electric field strength or the installation condition (combination of specific conditions such as antennas or wiring).

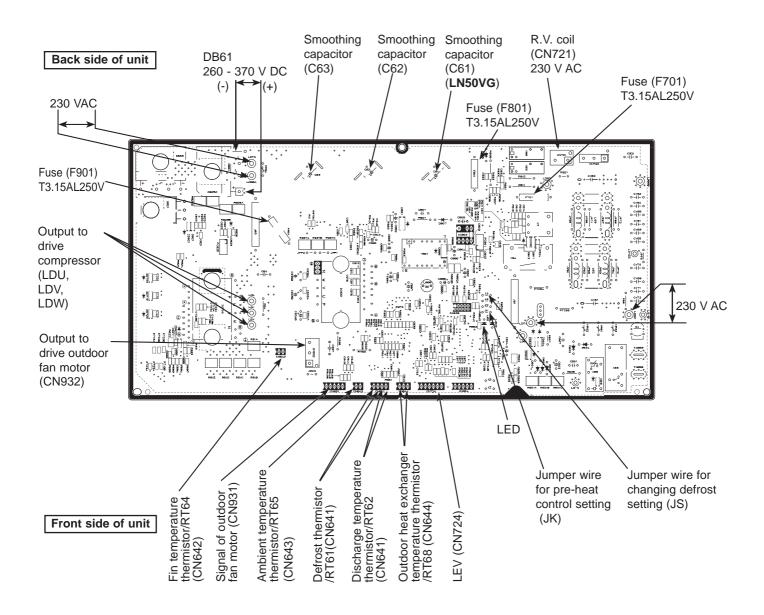

Check the following before asking for service.

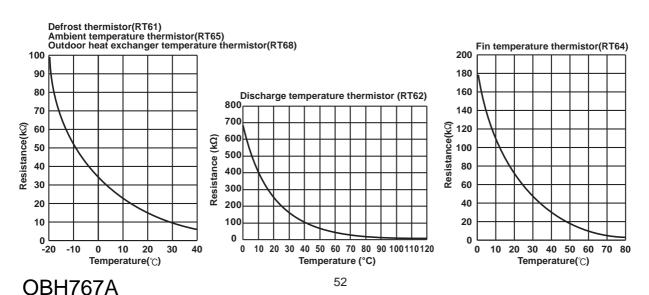

- 1. Devices affected by the electromagnetic noise
- TV sets, radios (FM/AM broadcast, shortwave)
- 2. Channel, frequency, broadcast station affected by the electromagnetic noise
- 3. Channel, frequency, broadcast station unaffected by the electromagnetic noise
- 4. Layout of:
- indoor/outdoor unit of the air conditioner, indoor/outdoor wiring, earth wire, antennas, wiring from antennas, receiver
- 5. Electric field intensity of the broadcast station affected by the electromagnetic noise
- 6. Presence or absence of amplifier such as booster
- 7. Operation condition of air conditioner when the electromagnetic noise enters in
- 1) Turn OFF the power supply once, and then turn ON the power supply. In this situation, check for the electromagnetic noise.
- 2) Within 3 minutes after turning ON the power supply, press STOP/OPERATE (OFF/ON) button on the remote controller for power ON, and check for the electromagnetic noise.
- 3) After a short time (3 minutes later after turning ON), the outdoor unit starts running. During operation, check for the electromagnetic noise.
- 4) Press STOP/OPERATE (OFF/ON) button on the remote controller for power OFF, when the outdoor unit stops but the indoor/outdoor communication still runs on. In this situation, check for the electromagnetic noise.

## **DISASSEMBLY INSTRUCTIONS**

#### <"Terminal with locking mechanism" Detaching points>

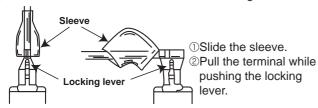

The terminal which has the locking mechanism can be detached as shown below.

There are 2 types (refer to (1) and (2)) of the terminal with locking mechanism.

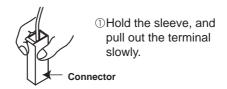

The terminal without locking mechanism can be detached by pulling it out.

Check the shape of the terminal before detaching.

(1) Slide the sleeve and check if there is a locking lever or not.

(2) The terminal with this connector has the locking mechanism.

#### 13-1. MUZ-LN25VG MUZ-LN35VG

NOTE: Turn OFF the power supply before disassembly.

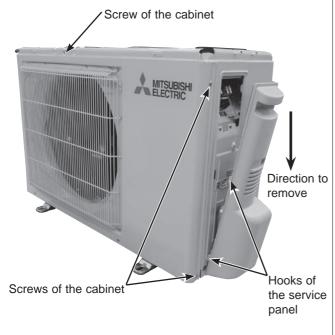

**PHOTOS** 

#### **OPERATING PROCEDURE**

#### 1. Removing the cabinet

- (1) Remove the screws fixing the service panel.
- (2) Pull down the service panel and remove it.
- (3) Disconnect the power supply and indoor/outdoor connecting wire.
- (4) Remove the screws fixing the top panel.
- (5) Remove the top panel.
- (6) Remove the screws fixing the cabinet.
- (7) Remove the cabinet.
- (8) Remove the screws fixing the back panel.
- (9) Remove the screws of the terminal block support and the back panel.
- (10) Remove the back panel.

#### Photo 2

# Screws of the top panel Back panel Back panel Screw of the service panel Screws of the cabinet

#### Photo 3

Screws of the terminal block support and the back panel

# 2. Removing the inverter assembly and inverter P.C. board

- (1) Remove the cabinet and panels. (Refer to 1.)
- (2) Disconnect the lead wire to the reactor and the following connectors:

<Inverter P.C. board>

CN721 (R.V. coil)

CN931, CN932 (Fan motor)

CN641 (Defrost thermistor and discharge temperature thermistor)

CN643 (Ambient temperature thermistor)

CN644 (Outdoor heat exchanger temperature thermistor)

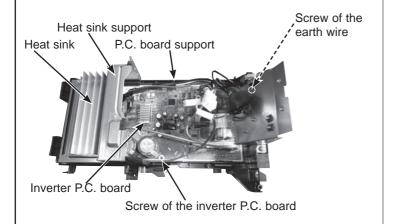

CN724 (LEV)

- (3) Remove the compressor connector (CN61).
- (4) Remove the screws fixing the heat sink support and the separator
- (5) Remove the fixing screw of the P.B. support and the separator.
- (6) Remove the fixing screws of the terminal block support and the back panel.
- (7) Remove the inverter assembly.
- (8) Remove the heat sink support from the P.C. board support.
- (9) Remove the screw of the inverter P.C. board and remove the inverter P.C. board from the P.C. board support.

# \* Connection procedure when attaching the inverter P.C. board (Photo 5)

- Connect the lead wires of the heat exchanger temperature thermistor to the connector on the inverter P.C. board. Pull the lead wires of the heat exchanger temperature thermistor toward you and put them on the left hook on the P.C. board support so that the other lead wires are bundled up as shown in Photo 5.
- 2. Connect the lead wires of the expansion valve coil to the connector on the inverter P.C. board. Pull the lead wires of the expansion valve coil toward you and put them on the right hook on the P.C. board support so that the other lead wires are bundled up as shown in Photo 5.

#### 3. Removing R. V. coil

- (1) Remove the cabinet and panels. (Refer to 1.)
- (2) Disconnect the following connectors: <Inverter P.C. board>
- CN721 (R.V. coil)
  (3) Remove the R.V. coil.

#### Photo 7

Outdoor heat exchanger temperature thermistor

# 4. Removing the discharge temperature thermistor, defrost thermistor, outdoor heat exchanger temperature thermistor and ambient temperature thermistor

- (1) Remove the cabinet and panels. (Refer to 1.)
- (2) Disconnect the lead wire to the reactor and the following connectors:
  - <Inverter P.C. board>
  - CN641 (Defrost thermistor and discharge temperature thermistor)
  - CN643 (Ambient temperature thermistor)
  - CN644 (Outdoor heat exchanger temperature thermistor)
- (3) Pull out the discharge temperature thermistor from its holder.
- (4) Pull out the defrost thermistor from its holder.
- (5) Pull out the outdoor heat exchanger temperature thermistor from its holder.
- (6) Pull out the ambient temperature thermistor from its holder.

#### Photo 8

Propeller fan

**PHOTOS** 

Propeller fan nut

#### 5. Removing outdoor fan motor

- (1) Remove the cabinet and panels. (Refer to 1.)
- (2) Disconnect the following connectors: <Inverter P.C. board> CN931, CN932 (Fan motor)
- (3) Remove the propeller fan nut.
- (4) Remove the propeller fan.
- (5) Remove the screws fixing the fan motor.
- (6) Remove the fan motor.

# **OPERATING PROCEDURE PHOTOS** 6. Removing the compressor and 4-way valve Photo 9 (1) Remove the cabinet and panels. (Refer to 1.) Discharge pipe Suction pipe (2) Remove the inverter assembly. (Refer to 2.) brazed part brazed part (3) Recover gas from the refrigerant circuit. NOTE: Recover gas from the pipes until the pressure gauge shows 0 kg/cm<sup>2</sup> (0 MPa). (4) Detach the brazed part of the suction and the discharge pipe connected with compressor. (5) Remove the compressor nuts. (6) Remove the compressor. (7) Detach the brazed part of pipes connected with 4-way valve. Discharge Brazed parts of 4-way valve temperature thermistor

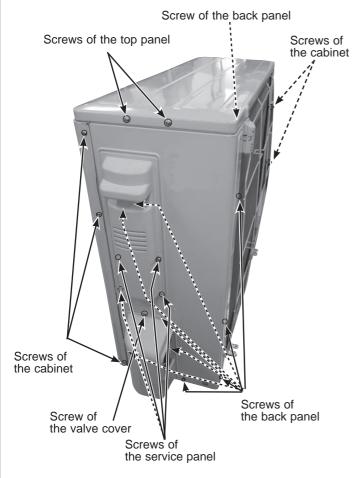

#### 13-2. MUZ-LN50VG

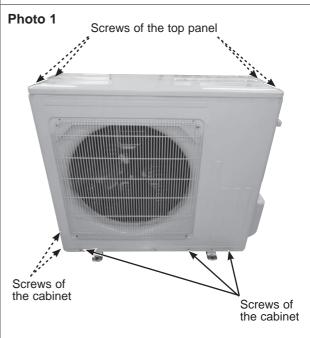

NOTE: Turn OFF the power supply before disassembly.

#### **OPERATING PROCEDURE PHOTOS** 1. Removing the cabinet Photo 1 Screws of the top panel (1) Remove the screws of the service panel. (2) Remove the screws of the top panel. (3) Remove the screw of the valve cover.

- (4) Remove the service panel.
- (5) Remove the top panel.
- (6) Remove the valve cover.
- (7) Disconnect the power supply and indoor/outdoor connecting wire.
- (8) Remove the screws of the cabinet.
- (9) Remove the cabinet.
- (10) Remove the screws of the back panel.
- (11) Remove the back panel.

#### 2. Removing the inverter assembly and inverter P.C. board

- (1) Remove the cabinet and panels. (Refer to 1.)
- (2) Disconnect the lead wire to the reactor and the following connectors:

<Inverter P.C. board>

CN721 (R.V. coil)

CN931, CN932 (Fan motor)

CN641 (Defrost thermistor and discharge temperature ther-

CN643 (Ambient temperature thermistor)

CN644 (Outdoor heat exchanger temperature thermistor)

CN724 (LEV)

- (3) Remove the compressor connector (CN61).
- (4) Remove the screws fixing the heat sink support and the sep-
- (5) Remove the fixing screw of the P.B. support and the separator.
- (6) Remove the fixing screws of the terminal block support and the back panel.
- (7) Remove the inverter assembly.
- (8) Remove the heat sink support from the P.C. board support.
- (9) Remove the screw of the inverter P.C. board and remove the inverter P.C. board from the P.C. board support.

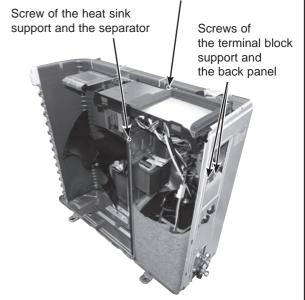

#### \* Connection procedure when attaching the inverter P.C. board (Photo 4)

- 1. Connect the lead wires of the heat exchanger temperature thermistor, the defrost thermistor and discharge temperature thermistor to the connector on the inverter P.C. board. Pull the lead wires toward you and put them on the right hook on the P.C. board support.
- 2. Connect the lead wires of the LEV to the connector on the inverter P.C. board. Pull the lead wires toward you and put them on the right hook on the P.C. board support.
- 3. Connect the lead wires of the ambient temperature thermistor to the connector on the inverter P.C. board. Pull the lead wires toward you and put them on the left hook on the P.C. board support so that the fan motor lead wires are bundled up as shown in Photo 4.

#### 3. Removing R. V. coil

- (1) Remove the cabinet and panels. (Refer to 1.)
- (2) Disconnect the following connectors: <Inverter P.C. board> CN721 (R.V. coil)
- (3) Remove the R.V. coil.

# 4. Removing the discharge temperature thermistor, defrost thermistor, outdoor heat exchanger temperature thermistor and ambient temperature thermistor

- (1) Remove the cabinet and panels. (Refer to 1.)
- (2) Disconnect the lead wire to the reactor and the following connectors:

<Inverter P.C. board>

CN641 (Defrost thermistor and discharge temperature thermistor)

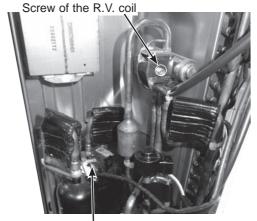

CN643 (Ambient temperature thermistor)

CN644 (Outdoor heat exchanger temperature thermistor)

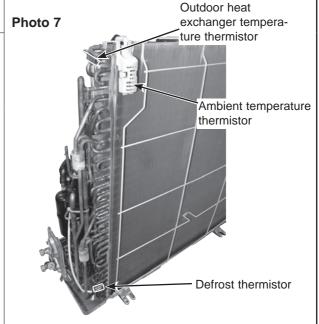

- (3) Pull out the discharge temperature thermistor from its holder.
- (4) Pull out the defrost thermistor from its holder.
- (5) Pull out the outdoor heat exchanger temperature thermistor from its holder.
- (6) Pull out the ambient temperature thermistor from its holder.

#### **PHOTOS**

Photo 6

Discharge temperature thermistor

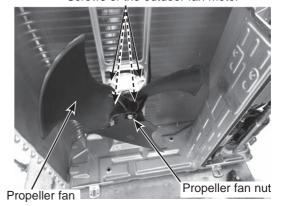

#### 5. Removing outdoor fan motor

- (1) Remove the cabinet and panels. (Refer to 1.)
- (2) Disconnect the following connectors: <Inverter P.C. board> CN931, CN932 (Fan motor)
- (3) Remove the propeller fan nut.
- (4) Remove the propeller fan.
- (5) Remove the screws fixing the fan motor.
- (6) Remove the fan motor.

Photo 8

# **OPERATING PROCEDURE PHOTOS** Photo 9 6. Removing the compressor and 4-way valve (1) Remove the cabinet and panels. (Refer to 1.) Discharge pipe Suction pipe (2) Remove the inverter assembly. (Refer to 2.) brazed part brazed part (3) Recover gas from the refrigerant circuit. NOTE: Recover gas from the pipes until the pressure gauge shows 0 kg/cm<sup>2</sup> (0 MPa). (4) Detach the brazed part of the suction and the discharge pipe connected with compressor. (5) Remove the compressor nuts. (6) Remove the compressor. (7) Detach the brazed part of pipes connected with 4-way valve. Brazed parts of 4-way valve

#### 13-3. MUZ-LN60VG

NOTE: Turn OFF the power supply before disassembly.

### **OPERATING PROCEDURE PHOTOS** 1. Removing the cabinet Photo 1 (1) Remove the screws of the service panel. Screws of the top panel (2) Remove the screws of the top panel. (3) Remove the screw of the valve cover. (4) Remove the service panel. (5) Remove the top panel. (6) Remove the valve cover. (7) Disconnect the power supply and indoor/outdoor connecting wire. (8) Remove the screws of the cabinet. (9) Remove the cabinet. (10) Remove the screws of the back panel. (11) Remove the back panel. the valve cover the service panel

# 2. Removing the inverter assembly and inverter P.C. board

- (1) Remove the cabinet and the service panel. (Refer to 1.)
- (2) Disconnect the lead wire to the reactor and the following connectors:

<Inverter P.C. board>

CN602 (R.V. coil)

CN931, CN932 (Fan motor)

CN671 (Defrost thermistor, discharge temperature thermistor and outdoor heat exchanger temperature thermistor)

CN672 (Ambient temperature thermistor)

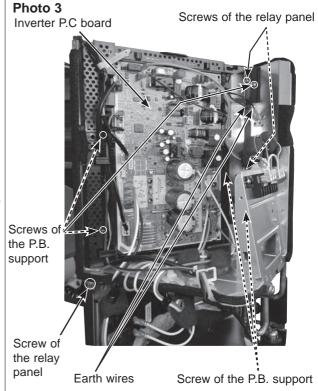

CN724 (LEV)

- (3) Remove the compressor connector.
- (4) Remove the earth wires and the lead wires of the inverter P.C. board.
- (5) Remove the screws of the P.B. support.
- (6) Remove the P.B. support from the relay panel.
- (7) Remove the screws of the inverter P.C. board.
- (8) Remove the inverter P.C. board from P.B. support.

#### \* Notes about attaching the inverter P.C. board

- 1. When attaching the inverter P.C. board, clip the lead wires of the reactor to the wire saddles on the bottom of relay panel.
- 2. After attaching the inverter P.C. board, make sure that the lead wires are connected and placed as shown in Photo 3.

#### **PHOTOS**

#### Photo 4

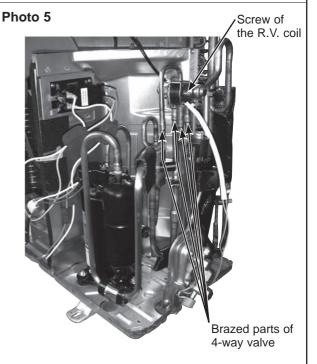

Screws of the inverter P.C. board

#### 3. Removing R.V. coil

- (1) Remove the cabinet and panels. (Refer to 1.)
- (2) Disconnect the following connector:
  <Inverter P.C. board>
  CN602 (R.V. coil)
- (3) Remove the R.V. coil.

#### **PHOTOS**

#### Removing the discharge temperature thermistor, defrost thermistor, outdoor heat exchanger temperature thermistor and ambient temperature thermistor

- (1) Remove the cabinet and panels. (Refer to 1.)
- (2) Disconnect the lead wire to the reactor and the following connectors:

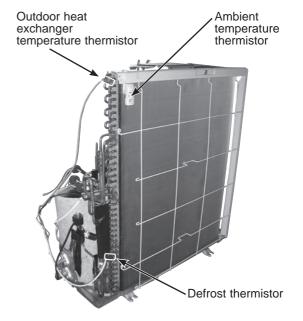

<Inverter P.C. board>

CN671 (Defrost thermistor, discharge temperature thermistor and outdoor heart exchanger temperature thermistor)

CN672 (Ambient temperature thermistor)

- (3) Pull out the discharge temperature thermistor from its holder. (Photo 9)
- (4) Pull out the defrost thermistor from its holder.
- (5) Pull out the outdoor heat exchanger temperature thermistor from its holder.
- (6) Pull out the ambient temperature thermistor from its holder.

#### Photo 6

#### 5. Removing outdoor fan motor

- (1) Remove the top panel, cabinet and service panel. (Refer to 1.)
- (2) Disconnect the following connectors: <Inverter P.C. board> CN931, CN932 (Fan motor)
- (3) Remove the propeller fan nut.
- (4) Remove the propeller fan.
- (5) Remove the screws fixing the fan motor.
- (6) Remove the fan motor.

#### 6. Removing the compressor and 4-way valve

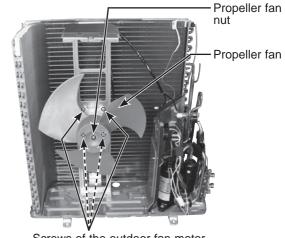

- (1) Remove the top panel, cabinet and service panel. (Refer to 1.)
- (2) Remove the back panel. (Refer to 1.)
- (3) Remove the screws fixing the relay panel.
- (4) Remove the relay panel.
- (5) Remove the inverter assembly. (Refer to 2.)
- (6) Recover gas from the refrigerant circuit.

**NOTE:** Recover gas from the pipes until the pressure gauge shows 0 kg/cm² (0 MPa).

- (7) Detach the brazed part of the suction and the discharge pipe connected with compressor.
- (8) Remove the compressor nuts.
- (9) Remove the compressor.
- (10) Detach the brazed parts of 4-way valve and pipe. (Photo 6)
